Introducing FDA-Approved Thermage NXT Next Generation Technology for Superior Skin Tightening

(Fayetteville, NC) Dr. Robert Clinton, Medical Director of Coressence Laser & Skin Center, has once again introduced a revolutionary aesthetic technology to his practice. Thermage NXT, also known as ThermaCool NXT, is the FDA-approved, next-generation technology for superior skin tightening and contouring used to target loose skin, lines and wrinkles of the face and body. Dr. Clinton is the first physician in Eastern North Carolina, including the Triangle, to acquire the Thermage NXT. Clinton explains, "Thermage NXT is more effective, faster, and twice as powerful as the previous model while maintaining a high level of safety. It is a perfect complement to SmartLipo or Fraxel."

Thermage NXT was developed to help erase the signs of aging skin. It works by targeting collagen structures beneath the skin's surface to tighten and firm underlying skin tissue. On the face, it is used for treating wrinkles around the forehead and eye, tightening the cheeks and jowl area, and reducing sagging under the chin. The treatment also can be used to tighten skin anywhere else on the body, including the tummy, breasts, thighs, arms, hands, lips and eyelids.

During Thermage NXT, a cooling tip protects the skin's surface while radio waves are applied to the deep layers of skin. The energy causes the collagen to contract and tighten. Increased collagen formation further tightens and lifts the skin without harming the epidermis. Such lifting and smoothing results were previously available only through invasive procedures. Also, Thermage NXT leaves no scarring.

This technology does not necessarily replace invasive procedures for those patients with excessive amounts of extra skin. It is extremely valuable, however, to most patients with some loose or flabby skin, and for those who want to avoid excessive downtime.

"If done properly, the Thermage, NXT technique should take from 30 minutes to less than two hours, and there is essentially zero downtime," says Dr. Clinton. "This is in stark contrast to traditional liposuction, tummy tuck or facelift surgery, which can sideline patients for up to several months."

Most patients see results immediately, with continued improvement over six months. Studies show that thermal collagen changes can last several years, depending on the rate of the aging process.

For more information regarding the Thermage NXT procedure or to set-up an interview with Dr. Robert Clinton, contact Jaime Alyn PR at 212-213-2003 or jaime@jaimealynpr.com.
